

KALRO/NAVCDP Factsheet No. 025/2024

## Integrated management of moles in Pyrethrum

## **Symptoms**

- Mole rat is an underground mammalian pest that destroy plants by feeding on roots and lower parts
  of plant stems; wilting of plants can be caused by such destruction.
- Soil mounds are usually an indicator of underground activity of mole rats.

## **Management Strategies**

The Integrated management of moles involves a myriad of management options. These are;

- Remove weeds in the farm and clear the bushy areas around the fields to reduce habitat
- areas and to reduce the populations of moles attacking the crop.
- Remove cereal heads, maize cobs, and/or tubers from the field after harvest to reduce breeding sites
- Use traps and decoy baits
- Put water barriers around the pyrethrum fields
